

Asset Naming and Texturing Standards

1. Naming Conventions

1.1 Meshes

Prefix: SM_

Definition: Static Mesh

Examples:

- SM_Crate_01
- SM_Barrel_Metal

1.2 Textures

Prefix: T_

Definition: Texture maps

Examples:

- T_Crate_BaseColor
- T_Crate_Normal
- T_Crate_Mask

Texture Type	Naming Convention Example
Base Color	T_Asset_BaseColor
Normal Map	T_Asset_Normal
Mask Map	T_Asset_Mask
Opacity / Alpha	T_Asset_Opacity (if separate)

1.3 Materials

Prefix: M_

Definition: Material instances or master materials

Examples:

- M_Crate
- M_Barrel_Rusted

2. Texture Packing Standards

To optimize performance and reduce texture memory usage, multiple maps are packed into a single Mask Map.

2.1 Mask Map Channel Packing

Channel	Usage
R (Red)	Ambient Occlusion (AO)
G (Green)	Roughness
B (Blue)	Metallic
A (Alpha)	Optional (Smoothness, Cavity, Opacity, etc.)

Example File Name: T_Crate_Mask

2.2 Example Texture Set for an Asset

For asset Crate:

- SM_Crate_01 (Static Mesh)
- M_Crate (Material)
- T_Crate_BaseColor (Base Color texture)
- T_Crate_Normal (Normal map)
- T_Crate_Mask (Mask map containing AO, Roughness, Metallic)

3. Best Practices

1. **Consistency First:** Always follow naming prefixes (SM_, T_, M_).
2. **Descriptive Naming:** Keep names clear and concise.
3. **Versioning:** Use numeric (_01, _02) or alphabetic (_A, _B) suffixes.
4. **Single Source of Truth:** Avoid duplicated materials/textures.
5. **Engine-Ready Assets:** Ensure frozen transforms, clean meshes, and packed textures before export.

.The URP package is inside URP folder and you can install the file

.The HDRP package is inside HDRP folder and you can install the file
